Personal Discovery Questions

Current workflow

1.

How do you currently book appointments?

2.

What steps do you usually follow before confirming a booking?

Pain points

3.

What frustrates you most about the current process?

4.

Have you ever missed or forgotten an appointment? Why?

Data

5.

What information should customers provide when booking?

6.

What information should staff be able to see?

Success

7.

What would make this system successful?

8.

How would you know the software is helping your business?

Security

9.

Who should be allowed to view customer bookings?

Failure

10.

What should happen if someone books an already occupied time slot?

Extra

11.

Should customers receive reminders?

12.

Should customers be allowed to cancel appointments?

Interview Evidence

Date: 2nd July 2026

Time: 9:44 PM

Medium: WhatsApp Chat

Participant: Salon Owner (Ms. Vanessa)

Evidence Type: Screenshots from Whatsapp

Summary: The client explained that appointments are currently recorded manually using WhatsApp messages and notebooks. Customers sometimes forget appointments, while double bookings occasionally occur. The client requested automatic booking confirmation, reminders, and better organization of appointment records. Personal contact information has been omitted to protect privacy.

is there anything you find wrong or missing with how th...

Overall, the diagram looks good and reflects how the salon operates. However, I suggest adding a few features: allowing guest bookings without registration, including online deposit payments (Mobile Money and card), letting clients view available time slots to prevent double bookings, and allowing clients to choose their preferred stylist during booking. These additions would make the system more complete and better suit the salon's needs.

Who updates prices/services when they change — you, or staff too?

Only the salon owner or an administrator has permission to update services, prices, and other business information.

10:15 PM

Is it just one salon location, or are there/will there be multiple branches?

10:15 PM ✓✓

Currently we have one salon location, but we'd like the website to support multiple branches in the future if we expand.

10:16 PM

Confirmations/reminders — SMS, WhatsApp, email, or a mix? Which does clients actually check?

You

Is payment required to book (deposit), or paid in person after service?

A deposit is required to secure every appointment. The remaining balance is paid after the service at the saloon

10:09 PM

If online payment is needed — mobile money, card, or both?

10:09 PM ✓✓

We accept both Mobile Money and bank card payments for online deposits and bookings.

10:10 PM

How many stylists currently work at the salon?

10:10 PM ✓✓

4 stylists currently work at the salon

10:12 PM

in with Google, or just phone/
email + password?

Won't take long, thank you again
for your time 🙏

2:22 AM ✓✓

Hi Gladys,
Since it's the client's request, we
suggest first finding out why
they want their data deleted by
providing a space for them to
state their reason. Once the
request is confirmed, their
personal data should be deleted
promptly, except where the salon
is legally required to retain
certain records (such as
completed payment or
transaction records).

5:15 AM

Secondly,for the sign-in, we
would prefer phone/email and
password only.

5:15 AM

Well noted .

Today

Hi Ms. Vanessa, sorry to bother you again — just 2 more quick questions before we finalize the requirements doc:

- 1.If a client asks us to delete their account/data, how long should we keep their info before deleting it (or should we delete right away)?
- 2.Should clients be able to sign in with Google, or just phone/email + password?

Won't take long, thank you again for your time 🙏

Requirement Transformation

"Sometimes two customers end up booking the same time."

In view of this, The system shall prevent double booking by allowing only one confirmed appointment for each available time slot.

The system shall respond within two seconds when checking appointment availability.

As a customer, I want to see available appointment times so that I can avoid selecting an unavailable slot.

Acceptance Criteria: Given an available slot, when the customer books it, then the booking is confirmed.

Given an occupied slot, when another customer selects it, then the system rejects the booking.

The customer receives a confirmation after booking.

Staff can view the updated appointment schedule immediately.

Possible API / Interface Implication

The system will require a booking interface where customers can select a service, date, and available time slot. A booking API endpoint (for example, **POST /appointments**) will validate availability before creating a booking.

Data Implication

The system should store the following information:

- Customer Name
- Phone Number
- Email Address (optional)
- Selected Service
- Appointment Date
- Appointment Time
- Appointment Status (Pending, Confirmed, Cancelled)
- Booking Creation Timestamp

Test Idea

Attempt to create two bookings for the same appointment time using different customer accounts. Verify that the first booking succeeds while the second booking is rejected with an appropriate error message.

Open Question

Should business staff have permission to override existing bookings or manually create appointments even when a time slot is already occupied?

Reflection

Before speaking with the client, I assumed that the most important feature of the system would simply be allowing customers to make appointments online. I believed that once customers could choose a date and time, most of the client's problems would be solved. However, after discussing the current workflow with the client, I realized that the real challenges were much broader than I had imagined.

The client explained that appointments are currently managed through WhatsApp messages and handwritten notes. Because of this, staff members spend a significant amount of time responding to customers individually, checking availability manually, and updating appointment records. I also learned that double bookings occasionally occur because there is no automatic validation of appointment slots. This was something I had not considered to be a major issue before the interview.

Another important lesson was the value of asking detailed questions instead of making assumptions. For example, I initially thought that customers only needed to book appointments, but the client emphasized the importance of receiving booking confirmations and reminders. This showed me that user satisfaction depends not only on the booking process itself but also on effective communication before the appointment.

The interview also strengthened my understanding of software requirements engineering. I learned that requirements should be based on real user needs rather than what developers believe users want. Transforming the client's statements into functional requirements, non-functional requirements, user stories, acceptance criteria, and system design implications helped me understand how software engineering converts business problems into practical software solutions.

Overall, this interview improved my understanding of the client's business processes and reminded me that successful software projects begin with careful listening, asking the right questions, and validating assumptions before designing or implementing any solution.
